Time log - Fourth iteration

Task: Coding the new functionality
Estimated time: 1 Hours
Actual time: 0.5 Hour
Explanation: Since we already had a similar solution for the HighScores class, I could reuse the structure and idea behind the code, which made this implementation a lot faster. I also implemented some functions just for testing purposes, but that was mainly printing functions which didn't really take any time coding.

Task: Creating UML Diagrams
Estimated time:2 Hours
Actual time: 1.5 Hour
Explanation: Since we used the same kind of structure we had for a previous part, we could estimate what the design would look like very early. Diagrams still take a lot of time to do, but we saved in some time since we did not have to change the class diagram.

Task: Testing
Estimated time:0.5 Hours
Actual time: 0.5 Hour
Explanation: All the previous tests have been run successfully, which means that I could spend the most time on just working on the newer test case and making sure that flow was working as intended.

Task: Verifying all the documentation
Estimated time:1 Hour
Actual time: 1.5 Hours
Explanation: This time was mainly spent looking through the current documentation and verifying that all the documentation was there and that everything has been accounted for. Turns out that there are a lot of documentation to update and fix before final release.
